

## **CAMLOUGH QUARRY**

### **Views About Management The Environment (Northern Ireland) Order 2002 Article 28(2)**

#### **A statement of the Department's views about the management of Camlough Quarry Area of Special Scientific Interest ("the ASSI")**

This statement represents the views of the Department about the management of the ASSI for nature conservation. This statement sets out, in principle, our views on how the area's special conservation interest can be conserved and enhanced. The Department has a duty to notify the owners and occupiers of the ASSI of its views about the management of the land.

Not all of the management principles will be equally appropriate to all parts of the ASSI and there may be other management activities, additional to our current views, which can be beneficial to the conservation and enhancement of the features of interest. It is also very important to recognise that management may need to change with time.

The management views set out below do not constitute consent for any operation or activity. The written consent of the Department is still required before carrying out any operation or activity likely to damage the features of special interest (see the Schedule on page 2 for a list of these operations and activities). The Department welcomes consultation with owners, occupiers and users of the ASSI to ensure that the management of this area maintains and enhances the features of interest, and to ensure that all necessary prior consents are obtained.

#### **MANAGEMENT PRINCIPLES**

The earth science interest at Camlough Quarry occurs as rock exposures in the faces of a disused quarry. The Department would encourage the maintenance of the ASSI and its earth science interest.

##### **The geological series**

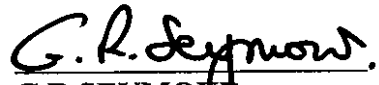

Provided no damaging activities, as set out in the Schedule (page 2), are undertaken without consent, the needs of owners, occupiers and the Department can be met. Earth science features such as those at Camlough Quarry may require occasional management intervention in order to maintain access to, and exposure of, the geology. This could include selective removal of vegetation or any major build up of loose rock.

Specific objectives include:

Maintain the geological series in an undamaged state.

Maintain access to the geological series.
