

RUNKERRY

Views About Management The Environment (Northern Ireland) Order 2002 Article 28(2)

A statement of Environment and Heritage Service's views about the management of the Runkerry Area of Special Scientific Interest ("the ASSI")

This statement represents the views of Environment and Heritage Service about the management of the ASSI for nature conservation. This statement sets out, in principle, our views on how the area's special conservation interest can be conserved and enhanced. Environment and Heritage Service has a duty to notify the owners and occupiers of the ASSI of its views about the management of the land.

Not all of the management principles will be equally appropriate to all parts of the ASSI and there may be other management activities, additional to our current views, which can be beneficial to the conservation and enhancement of the features of interest. It is also very important to recognise that management may need to change with time.

The management views set out below do not constitute consent for any operation or activity. The written consent of Environment and Heritage Service is still required before carrying out any operation or activity likely to damage the features of special interest (see the schedule on pages 2 and 3 of the attached Document B for a list of these operations and activities). Environment and Heritage Service welcomes consultation with owners, occupiers and users of the ASSI to ensure that the management of this area maintains and enhances the features of interest, and to ensure that all necessary prior consents are obtained.

MANAGEMENT PRINCIPLES

Coastal processes

Earth science features provide information about a region's geological history and can also aid interpretation of geological processes in the past and present.

The earth science interest at Runkerry occurs as the beach and associated dunes together with the offshore sediments within the adjoining bay. Environment and Heritage Service would encourage the maintenance of the ASSI and its earth science interest.

Provided no damaging activities, as set out in the Schedule (pages 2 and 3), are undertaken without consent, the needs of owners, occupiers and the Department can be met. Earth science features such as those at Runkerry may require occasional management intervention in order to maintain access to the features and continued operation of the processes on which these features depend. This could include selectively removing any major build up of debris.

Environment and Heritage Service would seek to maintain the coastline in as natural a state as possible. Sites such as Runkerry are particularly susceptible to damage through movement (other than through natural processes) or extraction of sediment (sand, gravel or other grade material) from anywhere within the site or the offshore area and to any alteration of the coastline.

Specific objectives include:

Maintain the physiographical series in an undamaged state.

Maintain access to the physiographical series.

E Diane Stevenson
