

TULLYSRANADEEGA

Views About Management The Environment (Northern Ireland) Order 2002 Article 28(2)

A statement of Environment and Heritage Service's views about the management of Tullysrnadeega Area of Special Scientific Interest ("the ASSI")

This statement represents the views of Environment and Heritage Service about the management of the ASSI for nature conservation. This statement sets out, in principle, our views on how the area's special conservation interest can be conserved and enhanced. Environment and Heritage Service has a duty to notify the owners and occupiers of the ASSI of its views about the management of the land.

Not all of the management principles will be equally appropriate to all parts of the ASSI and there may be other management activities, additional to our current views, which can be beneficial to the conservation and enhancement of the features of interest. It is also very important to recognise that management may need to change with time.

The management views set out below do not constitute consent for any operation or activity. The written consent of Environment and Heritage Service is still required before carrying out any operation or activity likely to damage the features of special interest (see the schedule on pages 3-4 of the attached Document B for a list of these operations and activities). Environment and Heritage Service welcomes consultation with owners, occupiers and users of the ASSI to ensure that the management of this area maintains and enhances the features of interest, and to ensure that all necessary prior consents are obtained.

MANAGEMENT PRINCIPLES

Grasslands are an important habitat for wildlife. Environment and Heritage Service would encourage the maintenance and enhancement of the grassland, through the conservation of its associated native plants and animals.

Many of the more sensitive species can be quickly lost through intensive management treatments, such as fertiliser and herbicide application. However, grassland generally needs some management to retain its interest. Although occasional small patches of scrub can be valuable in providing additional habitat niches for birds and invertebrates, in the absence of management, coarse grasses can quickly take over and ultimately woody species may become dominant.

Low intensity cutting for hay and low intensity grazing by cattle are the most effective ways of controlling the growth of more vigorous species and helping to maintain open

areas and a diverse sward structure. In the total absence of grazing, cutting of the vegetation to create open areas and reduce the dominance of coarse grasses is desirable.

Specific objectives include:

Over much of the site low intensity grazing has contributed to the conservation and enhancement of the features of interest. Environment and Heritage Service would encourage the continuation of this practice.

In some parts of the site management for hay has contributed to the conservation and enhancement of the features of interest. Environment and Heritage Service would encourage the continuation of this practice.

Prevent the loss of more sensitive grassland species through the control of vigorous grasses and rushes. In general, this can be achieved through the appropriate cutting or grazing regime.

Maintain the short swards present on old banks, which are important for rare grassland plant species.

Where necessary, encourage the blocking of drains to prevent the grassland from drying out.

Ensure that disturbance to the site and its wildlife is minimised.

Discourage non-native species, especially those that tend to spread at the expense of native wildlife.

Maintain the diversity and quality of habitats associated with the grassland, such as, rivers, wet and dry heath, hedgerows and semi-natural woodland and scrub through sensitive management. These adjoining habitats can often be very important for wildlife.
